3.1: Basic CSS

- 3.1: Basic CSS
- 3.2: CSS Properties
- 3.3: More CSS Syntax

The bad way to produce styles

```
<font face="Arial">Welcome to Greasy Joe's.</font>
You will <b>never</b>, <i>>ever</i>, <u>EVER</u> beat
<font size="+4" color="red">OUR</font> prices!

Welcome to Greasy Joe's. You will never, ever, EVER beat OUR prices!
```

tags such as b, i, u, and font are discouraged in strict HTML
 Why is this bad?

Cascading Style Sheets (CSS): <link>

```
<head>
...
head>
...
href="filename" type="text/css" rel="stylesheet" />
...
</head>
```

<link href="style.css" type="text/css" rel="stylesheet" />

- CSS describes the appearance and layout of information on a web page of (as opposed to HTML, which describes the content of the page)
- can be embedded in HTML or placed into separate .css file (preferred)

Basic CSS rule syntax

```
selector {
   property: value;
   property: value;
...
   property: value;
}

p {
   font-family: sans-serif;
   color: red;
}
```

- a CSS file consists of one or more rules
- a rule's selector specifies HTML element(s) and applies style properties
 - a selector of * selects all elements

CSS properties for colors

```
p {
    color: red;
    background-color: yellow;
}
This paragraph uses the style above.
```

property	description
color	color of the element's text
background-color	color that will appear behind the element

Specifying colors

```
p { color: red; }
h2 { color: rgb(128, 0, 196); }
h4 { color: #FF8800; }

This paragraph uses the first style above.

This h2 uses the second style above.

This h4 uses the third style above.
```

- color names: aqua, black, blue, fuchsia, gray, green, lime, maroon, navy, olive, purple, red, silver, teal, white (white), yellow
- RGB codes: red, green, and blue values from 0 (none) to 255 (full)
- hex codes: RGB values in base-16 from 00 (0, none) to FF (255, full)

CSS properties for fonts

property	description
font-family	which font will be used
font-size	how large the letters will be drawn
font-style	used to enable/disable italic style
font-weight	used to enable/disable bold style
Complete list of font properties	

font-family

```
p {
   font-family: Georgia;
}
h2 {
   font-family: "Courier New";
}
```

This paragraph uses the first style above.

This h2 uses the second style above.

• enclose multi-word font names in quotes

More about font-family

```
p {
    font-family: Garamond, "Times New Roman", serif;
}
This paragraph uses the above style.
```

- can specify multiple fonts from highest to lowest priority
- generic font names: serif, sans-serif, cursive, fantasy, monospace
- if the first font is not found on the user's computer, the next is tried
- generally should specify similar fonts
- placing a generic font name at the end of your font-family value ensures that every computer will use a valid font

font-size

```
p {
    font-size: 14pt;
}
This paragraph uses the style above.
```

- units: pixels (px) vs. point (pt) vs. m-size (em) 16px, 16pt, 1.16em
- vague font sizes: xx-small, x-small, small, medium, large, x-large, xx-large, smaller, larger
- percentage font sizes, e.g.: 90%, 120%
- pt specifies number of point, where a point is 1/72 of an inch onscreen
- px specifies a number of pixels on the screen
- em specifies number of m-widths, where 1 em is equal to the font's current size

font-weight, font-style

```
p {
   font-weight: bold;
   font-style: italic;
}
This paragraph uses the style above.
```

• either of the above can be set to normal to turn them off (e.g. headings)

font

```
p {
    font: italic bold 14px "Arial", cursive;
}

This paragraph uses the style above.
```

• can set many aspects of the fint in one step (short cut property)

Recall: Basic CSS rule syntax

```
selector {
    property: value;
    property: value;
    ...
    property: value;
}

p {
    font-family: sans-serif;
    color: red;
}
```

Grouping styles

```
p, h1, h2 {
   color: green;
}
h2 {
   background-color: yellow;
}
This paragraph uses the above style.

This h2 uses the above styles.
```

- a style can select multiple elements separated by commas
- the individual elements can also have their own styles (like h2 above)

CSS comments: /* ... */

```
/* This is a comment.
  It can span many lines in the CSS file. */
p {
  color: red;
  background-color: aqua;
}
```

- CSS (like HTML) is usually not commented as much as code such as Java
- the // single-line comment style is NOT supported in CSS
- the <!-- ... --> HTML comment style is also NOT supported in CSS

W3C CSS Validator

```
 <a href="https://jigsaw.w3.org/css-validator/check/referer"> <img src="http://jigsaw.w3.org/css-validator/images/vcss" alt="Valid CSS!" /></a>
```

- jigsaw.w3.org/css-validator/
- checks your CSS to make sure it meets the official CSS specifications
- · more picky than the web browser, which may render malformed CSS correctly

3.2: CSS Properties

- 3.1: Basic CSS
- 3.2: CSS Properties
- 3.3: More CSS Syntax

CSS properties for text

property	description
text-align	alignment of text within its element
text-decoration	decorations such as underlining
text-indent	indents the first letter of each paragraph
text-shadow	a colored shadow near an existing piece of text 💆
line-height, word-spacing, letter-spacing	gaps between the various portions of the text
Complete list of text properties	

text-align

```
blockquote { text-align: justify; }
h2 { text-align: center; }
```

The Emperor's Quote

[TO LUKE SKYWALKER] The alliance... will die. As will your friends. Good, I can feel your anger. I am unarmed. Take your weapon. Strike me down with all of your hatred and your journey towards the dark side will be complete.

• can be left, right, center, or justify (which widens all full lines of the element so that they occupy its entire width)

text-decoration

```
p {
    text-decoration: underline;
}
This paragraph uses the style above.
```

- can also be overline, line-through, blink, or none
- effects can be combined:

text-decoration: overline underline;

text-shadow 5

```
p {
    font-weight: bold;
    text-shadow: -2px 5px gray;
}
This paragraph uses the style above.
```

• shadow is specified as an X-offset, a Y-offset, and an optional color

CSS properties for backgrounds

property	description
background-color	color to fill background
background-image	image to place in background
background-position	placement of bg image within element
background-repeat	whether/how bg image should be repeated
background-attachment	whether bg image scrolls with page
background	shorthand to set all background properties

background-image

```
body {
    background-image: url("images/draft.jpg");
}
This is the first paragraph
This is the second paragraph...
It occupies 2 lines
```

• background image/color fills the element's content area

background-repeat

```
body {
  background-image: url("images/draft.jpg");
  background-repeat: repeat-x;
}
This is the first paragraph
This is the second paragraph...
It occupies 2 lines
```

• can be repeat (default), repeat-x, repeat-y, or no-repeat

background-position

```
body {
  background-image: url("images/draft.jpg");
  background-repeat: no-repeat;
  background-position: 370px 20px;
}

This is the first paragraph

This is the second paragraph...
It occupies 2 lines
```

- value consists of two tokens, each of which can be top, left, right, bottom, center, a percentage, or a length value in px, pt, etc.
- value can be negative to shift left/up by a given amount

The list-style-type property

```
ol { list-style-type: lower-roman; }

Possible values:
    i. none : No marker
    ii. disc (default), circle, square
    iii. decimal : 1, 2, 3, etc.
    iv. decimal-leading-zero : 01, 02, 03, etc.
    v. lower-roman : i, ii, iii, iv, v, etc.
    vi. upper-roman : I, II, III, IV, V, etc.
    vii. lower-alpha : a, b, c, d, e, etc.
    viii. upper-alpha : A, B, C, D, E, etc.
    ix. lower-greek : alpha, beta, gamma, etc.
    x. others: hebrew, armenian, georgian, cjk-ideographic, hiragana, katakana, hiragana-iroha, katakana-iroha
```

Styling tables

```
table { border: 2px solid black; caption-side: bottom; }
tr { font-style: italic; }
td { background-color: yellow; text-align: center; width: 30%; }
Column 1 Column 2
```

 Column 1
 Column 2

 1,1
 1,2 okay

 2,1 real wide
 2,2

My important data

- · all standard CSS styles can be applied to a table, row, or cell
- table specific CSS properties:
 - border-collapse, border-spacing, caption-side, empty-cells, table-layout

The border-collapse property

```
table, td, th { border: 2px solid black; }
table { border-collapse: collapse; }
```

Without bordercollapse

Column 1	Column 2
1,1	1,2
2,1	2,2

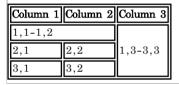

With bordercollapse

Column 1	Column 2
1,1	1,2
2,1	2,2

- by default, the overall table has a separate border from each cell inside
- the border-collapse property merges these borders into one

The rowspan and colspan attributes

```
Column 1Column 2Column 3
1,1-1,2
1,3-3,3
2,12,1
3,1
```

- colspan makes a cell occupy multiple columns; rowspan multiple rows
- text-align and vertical-align control where the text appears within a cell

Column styles: <col>, <colgroup>

Column 1	Column 2	Column 3
1,1	1,2	1,3
2,1	2,2	2,3

- col tag can be used to define styles that apply to an entire column (self-closing)
- colgroup tag applies a style to a group of columns (NOT self-closing)

Don't use tables for layout!

- (borderless) tables appear to be an easy way to achieve grid-like page layouts
 many "newbie" web pages do this
- · but, a table has semantics; it should be used only to represent an actual table of data
- instead of tables, use divs, widths/margins, floats, etc. to perform layout
- tables should not be used for layout!
- Tables should not be used for layout!!
- TABLES SHOULD NOT BE USED FOR LAYOUT!!!
- TABLES SHOULD NOT BE USED FOR LAYOUT!!!!

CSS 3 new features

- new selectors: nth-child, inline-block, :not, +
- ability to **embed fonts** in a page (yay)
- · easy built-in support for multi-column layouts

T his page demonstrates CSS3 multicolumns, rounded corners, text & box shadows, HSL/HSLA colour selection, nth-*

be floated or positioned (→ Bug 238072). Column text flow is much improved and border-radius is now antialiased.

of the CSS2 or CSS3 specifically tested. L of support for position:fixed and PNG al transparency renders the header and for

• transparency/opacity, color gradients, shadows

• rounded corners/borders

Example 2

animations and transitions (like Scriptaculous)

• affine transformations (scaling, rotation, perspective)

3.3: More CSS Syntax

• 3.1: Basic CSS

• 3.2: CSS Properties

• 3.3: More CSS Syntax

Body styles

```
body {
  font-size: 16px;
}
```

- to apply a style to the entire body of your page, write a selector for the body element
- · saves you from manually applying a style to each element

Styles that conflict

```
body { color: green; }
p, h1, h2 { color: blue; font-style: italic; }
h2 { color: red; background-color: yellow; }

This paragraph uses the first style above.

This heading uses both styles above.
```

- when two styles set conflicting values for the same property, the latter style takes precedence
- (later we will learn about more specific styles that can override more general styles)

Embedding style sheets: <style> (BAD!)

```
<head>
     <style type="text/css">
        p { font-family: sans-serif; color: red; }
        h2 { background-color: yellow; }
      </style>
</head>
```

- CSS code can be embedded within the head of an HTML page
- this is bad style; DO NOT DO THIS (why?)

Inline styles: the style attribute (BAD!)

```
This is a paragraph
This is a paragraph
```

- · higher precedence than embedded or linked styles
- used for one-time overrides and styling a particular element
- this is bad style; DO NOT DO THIS (why?)

Content vs. presentation

- HTML is for **content**; what is on the page (heading; list; code; etc.)
- CSS is for presentation; how to display the page (bold; centered; 20px margin; etc.)
- keeping content separate from presentation is a very important web design principle
- If the HTML contains no styles, its entire appearance can be changed by swapping .css files
- see also: CSS Zen Garden

Cascading style sheets

- it's called Cascading Style Sheets because the properties of an element cascade together in this order:
 - browser's default styles (reference)
 - external style sheet files (in a <link> tag)
 - internal style sheets (in a <style> tag in the page header)
 - inline style (the style attribute of an HTML element)

Inheriting styles

```
body { font-family: sans-serif; background-color: yellow; }
p { color: red; background-color: aqua; }
a { text-decoration: overline underline; }
h2 { font-weight: bold; text-align: center; }

This is a heading.

A styled paragraph. Previous slides are available on the web site.

• a bulleted list
```

- when multiple styles apply to an element, they are inherited
- · a more tightly matching rule can override a more general inherited rule
- not all properties are inherited (notice link's color above)

IDs & ID selectors

```
#id {
    property: value;
    property: value;
    ...
    property: value;
}
<h2 id="asia">Korea</h2>
#asia {
    font-style: italic;
}

Korea
```

- each ID must be unique throughout the HTML document
- the value of ID attribute begins with a letter, followed by letters, digits, hyphens, underscore, colons, and periods
- ID can also be used in HTML to link to a section of a page

Classes & Class selectors

- · class attribute is an identifier you can attach to any HTML element
- · multiple elements can have the same class value

CSS pseudo-classes

```
a:link { color: #FF0000; } /* unvisited link */
a:visited { color: #00FF00; } /* visited link */
a:hover { color: #FF00FF; } /* mouse over link */
Check out the CSE dept. webpage!
```

class	description
:active	an activated or selected element
:focus	an element that has the keyboard focus
:hover	an element that has the mouse over it
:link	a link that has not been visited
:visited	a link that has already been visited
:first-letter	the first letter of text inside an element
:first-line	the first line of text inside an element
:first-child	an element that is the first one to appear inside another
:nth-child(N)	applies to every Nth child of a given parent
